Typical Applications

The HMC320MS8G(E) is ideal for:

- UNII
- HiperLAN

Features

- Selectable Functionality:
LNA, Driver, or LO Buffer Amp
- Adjustable Input IP3 Up to +10 dBm
- +3V Operation
- Ultra Small 8 Lead MSOP: 14.8 x 14.8 x 1 mm

Functional Diagram

General Description

The HMC320MS8G & HMC320MS8GE are low cost C-band fixed gain Low Noise Amplifiers (LNA). The HMC320MS8G & HMC320MS8GE operate using a single positive supply that can be set between +3V and +5V. With +3V bias, the LNA provides a noise figure of 2.5 dB, 1 dB gain and better than 10 dB return loss across the UNII band. The HMC320MS8G & HMC320MS8GE also feature an adaptive biasing that allows the user to select the optimal P1dB performance for their system using an external set resistor on the "RES" pin. P1dB performance can be set between a range of +1 dBm to +13 dBm. The low cost LNA uses an 8-leaded MSOP ground base surface mount plastic package, which occupies less than 14.8 mm².

Adaptive Biasing

Optimizing P1dB Performance

The bias level may be changed to adjust the P1dB and return loss performance. The table below contains the HMC-320MS8G RF performance as a function of various VSET and RBIAS settings. It will be necessary for the VSET voltage source to provide 100uA of current to the amplifier. The Idd and Vdd quiescent performance will not change as a function of changing the VSET voltage.

RF Performance at 5.8 GHz (Vdd = +3V)

VSET (VDC)	RBIAS Resistor Between Pin 3 and GND (Ohms)	Idd (mA)	Output P1dB (dBm)	Output Return Loss (dB)
0	174	7	1.0	16.0
3	22	25	9.0	12.0
3	7	40	13.0	15.0
3	GND (No Resistor)	60	14.0	15.0

Applying the adaptive biasing

A dynamically controlled bias can be implemented with this design. A typical application will include sensing an RF signal level and then adjusting the VSET. The bias adjustment can be accomplished by either analog or digital means, after the RF signal has been detected and translated to a DC voltage using external power detection circuitry.

NOTES:

- LEADFRAME MATERIAL: COPPER ALLOY
- DIMENSIONS ARE IN INCHES (MILLIMETERS)
- DIMENSION DOES NOT INCLUDE MOLDFLASH OF 0.15mm PER SIDE.
- DIMENSION DOES NOT INCLUDE MOLDFLASH OF 0.25mm PER SIDE.
- ALL GROUND LEADS AND GROUND PADDLE MUST BE SOLDERED TO PCB RF GROUND.

[2] Circuit Board Material: Rogers 4350

The circuit board used in the final application should use RF circuit design techniques. Signal lines should have 50 ohm impedance while the package ground leads and exposed paddle should be connected directly to the ground plane similar to that shown. A sufficient number of via holes should be used to connect the top and bottom ground planes. The evaluation circuit board shown is available from Hittite upon request.
