**Characteristics**

**Remark:**

Reference level for the relative attenuation  $a_{rel}$  is the pass band attenuation  $a_0$  at nominal frequency. It is defined as the insertion loss  $a_e$ . The nominal frequency  $f_N$  is fixed to 190.0 MHz. The given values for the insertion loss, the relative attenuation  $a_{rel}$  and the group delay ripple have to be reached at the frequencies given below also if the centre frequency  $f_c$  is shifted due to the temperature coefficient of frequency  $TC_f$  in the operating temperature range and due to a production tolerance for the centre frequency  $f_c$ .
