

**VI TELEFILTER****Filter Specification****TFS 350A****1/5****Measurement condition**

Ambient Temperature: 23 °C  
 Input Power Level: 0 dBm  
 Terminating Impedance at  $f_C^*$ : input: 246  $\Omega$  // -6,4 pF  
 output: 266  $\Omega$  // -6,4 pF

**Characteristics****Remark:**

The reference level for the relative attenuation  $a_{rel}$  of TFS 350A is the minimum of the pass band attenuation  $a_{min}$ . This minimum is defined as the insertion loss  $a_e$ . The nominal frequency  $f_N$  is fixed at 350 MHz without any tolerance. The given values for the relative attenuation  $a_{rel}$  and the group delay ripple have to be reached at the frequencies given below, even if the centre frequency  $f_C$  is shifted due to the temperature coefficient of frequency  $TC_f$  in the operating temperature range and due to a production tolerance for centre frequency  $f_C$ .

<b>D a t a</b>		<b>typ. Value</b>	<b>Limit</b>

\*) The terminating impedances depend on parasitics and q-values of matching elements and the board used, and are to be understood as reference values only. Should there be additional questions, do not hesitate to ask for an application note or contact our design team.

\*\*\*)  $\Delta f(\text{Hz}) = TC_f(\text{ppm/K}^2) \times (T - T_0)^2 \times f_{T0}(\text{MHz})$
